

## Week2Day1-Assignment

LLM Used: Claude AI

### Query: Selenium or Playwright which one is better?

Both are solid choices, and the "better" one really depends on your use case. Here's a practical breakdown:

#### Playwright is better if you...

- Are starting a **new project** — it's the modern standard
- Need **speed**: Playwright runs tests in parallel across browsers natively and is significantly faster
- Want **built-in features** out of the box: auto-waiting, network interception, tracing, video recording, screenshot diffing
- Work with **modern web apps** (SPAs, dynamic content, shadow DOM)
- Prefer **multiple languages**: JavaScript/TypeScript, Python, Java, C#
- Need reliable **async support** — Playwright was designed async-first

#### Selenium is better if you...

- Are maintaining a **legacy codebase** already built on Selenium
- Need to support **older browsers** or very specific enterprise browser environments
- Work in an org with existing **Selenium Grid infrastructure**
- Require **maximum language support** — Selenium supports Ruby and PHP too
- Need to test on **real mobile browsers** via Appium (Selenium's ecosystem)

#### Quick comparison

| Feature         | Playwright                                                                                   | Selenium                                                                                         |
|-----------------|----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| Speed           |  Fast     |  Slower       |
| Setup           | Simple                                                                                       | More config                                                                                      |
| Auto-waiting    |  Built-in |  Manual waits |
| Browser support | Chromium, Firefox, WebKit All major + older                                                  |                                                                                                  |

| Feature            | Playwright   | Selenium         |
|--------------------|--------------|------------------|
| Community/maturity | Growing fast | Very established |
| Flakiness          | Low          | Higher           |
| Mobile testing     | Limited      | Strong (Appium)  |

### Bottom line

**Choose Playwright** for new projects — it's faster, less flaky, and requires far less boilerplate. **Stick with Selenium** if you have legacy tests, need broad browser/mobile coverage, or your team is already deeply invested in the Selenium ecosystem.

\*\*\*\*\*

### LLM Used: ClaudeAI

#### TL/DR : Selenium or Playwright which one is better?

**Claude responded: Playwright — it's faster, less flaky, and has better built-in tooling.**

**Playwright** — it's faster, less flaky, and has better built-in tooling. Unless you're maintaining legacy Selenium tests, there's no good reason to start new projects with Selenium today.

.....

#### **ELI-15:Selenium or Playwright which one is better?**

**Claude responded: Imagine you're building a robot that clicks around websites for you.**

Imagine you're building a robot that clicks around websites for you.

**Selenium** is the old robot — been around forever, everyone knows it, but it's clunky and you have to babysit it constantly (like manually telling it "wait for the page to load").

**Playwright** is the newer, smarter robot — it figures things out on its own, runs faster, and doesn't break as much.

If you're starting fresh, just use **Playwright**. Selenium only makes sense if you're inheriting someone else's old code.

**Observation:**

1. Regular prompt provides detailed answer for whether playwright or selenium is better? Quick comparison, features, which tool is better in which condition.
2. TL/DR prompt condenses the big content into a precise summary. Provided the clear answer that Playwright is the better tool with two line summary
3. EL-15 prompt provides little bit more detailed answer than TL/DR but not as detailed as regular prompt. Simplified the topics to high school level understanding. Provided details on both playwright and selenium features in few lines.
